
Background

In 2023, a team of US university researchers wanted to complement their analysis of corruption in African resource extraction with a subnational GDP analysis.

Approach

Tellusant pulled data for over 600 subnational entities (provinces, states, regions, etc.) from **TelluBase**, which covers all African nations.

After testing the data, the researchers added this analytical element.

Outcome

The subnational data set was pulled quickly and made available to the university within a few days. It is now added to the pre-press version of the paper.
